**Guidelines for Project 1 Presentations:**

First read the General Presentation Guidelines document in the Guidelines folder.

**Team 1** should focus on demonstrating the features of the provided specification to help the class understand what it does. Things you might consider including:
- Show a simple execution using LTSA.
- Highlight some specific parts of the specification to illustrate some of the key techniques and structures used in the specification.

Note: you should *not* directly answer the questions on the Project description.

**Team 2 and Team 3** should focus on ways to extend the current specification. For example, pick one kind of new feature and indicate how you might go about adding it to the existing specification. Try to elucidate any design tradeoffs that might have to be made.
